

Chomsky – Syntax for a Mathematical Perspective on Integrated Method

By Shomit Sirohi

Introduction

By Noam Chomsky

In fact then elegance is
linguistics and
mathematics – love the
formalism called

mathematical
applications in
Americanism – love it,
absolute.

1. Basic Mathematics
in a Perspective
which is just
dialectical but in
formal negation –
like Badiou, but more
formal –

Example – a Perspective on Statistics, formally negated, in full formalism as in fact statistical averages, forms of statistical coverage of peasant agriculture in Annales.

2. Mathematics in Nobel Prize style –

Imagine a board – which then carries in it a complex number of

numerical series, and statistics, with in fact economics as a bias – this covers accounts only – science means such things.

3. Why be Dialectical – it is the simple mathematical nature of the dialectic in Sirohi.

Part 2 Chopin

1,1 – 2,2 – 3,3 – A
simple way of doing
mathematical
applications is called
basketball – its process
is just to align
basketball with
mathematical formalism
– now it keeps totalizing
–

The development of
capitalism in Russia by
Lenin then is an
aggregate serfdom with

a mediation of low
waged working classes
and even high industrial
manufacturing which
was mediated in turn by
the Tsarists and was a
dictatorship with some
urbanism and even
intellectual unique
patterns of education –
all of this is then a
constituted dialectic
which has in it a
constituent dialectics
of Lenin and Trotsky –
which then covers also

the current history of
Cuba as somehow
mediating better its
social formalisms.

Mathematics though
accounts for these
social developments in
line with basketball –
how in fact Mcshull
develops in American
transitions to capitalism
as financial formalisms –
which then means
Taylorism for the world
which becomes Fordism

in Mandel as important
to the manufacturing
forms of the world.

All of this is
mathematical in the
sense of its elegance
even in Chomsky's
linguistics here.
